Alaska Economic Trends is a monthly publication dealing with a variety of economic-related issues in the state.

Alaska Economic Trends is funded by the Employment Security Division and published by the Department of Labor and Workforce Development, P.O. Box 21149, Juneau, Alaska 99802-1149.

Printed and distributed by Assets, Inc., a vocational training and employment program, at a cost of \$1.39 per copy.

To contact us for more information, to subscribe, or for mailing list changes or back copies, email trends@labor.state.ak.us

Material in this publication is public information and, with appropriate credit, may be reproduced without permission.

Trends is available on the Internet. See URL above.

The Cost of Living in Alaska

by Neal Fried and
Dan Robinson, Economists

Alaska is not as expensive as it used to be, relative to the other states

For years Alaska was correctly considered one of the most expensive places to live in the nation. As recently as 1997, the American Chamber of Commerce Researchers (ACCRA) cost of living survey listed four Alaska cities in the eight most expensive cities in the U.S. By 2003, only Juneau and Kodiak made the top twenty and they were down to 16th and 17th, respectively. Taken as a whole, the ACCRA survey and other cost of living measures reveal that living costs in Alaska are not as high relative to the rest of the country as they once were. The state's population has grown and technology has brought advances both in the ability of the state to supply more of its own goods and services and also to obtain goods from national and international markets.

This article looks at the most recent data from a variety of cost of living surveys.

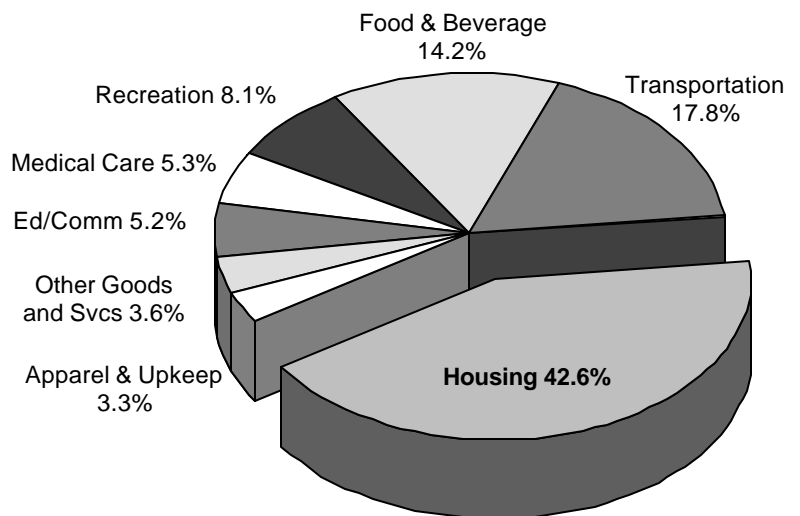

Cost of living measures are of two kinds

Cost of living measures come in two different types. The first indicates the change in the cost of living over time. The Consumer Price Index (CPI), often referred to as the inflation rate, is the principal measure of this type. The CPI is used by landlords, workers, unions, and employers to adjust rents and salaries, among other things. The Alaska Permanent Fund Corporation uses the CPI to determine how much money must be added to the principal of the Permanent Fund to keep up with inflation.

The other type of cost of living measure examines cost differences among places at a specific point in time. Measures of this type can answer questions about whether it's more expensive to live in Fairbanks or Ketchikan, for example. Certain items are selected for comparison and then a survey is conducted to determine how much the items cost in different locations.

Some surveys of this type look at how much it would cost in different locations to maintain a certain standard of living. In other words, if a person can afford to live in a three bedroom

home, eat out twice a week, and drive a late-model car in Boise, Idaho on an income of \$40,000 a year, how much more or less would it cost to maintain the same living standards in Boston, Massachusetts? Comparisons such as these play a big role in relocation decisions. Several measures of this type will be discussed in this article.

Use measures with caution

All cost of living measures have shortcomings and limitations which users need to recognize. Since it is not feasible to price every item available, cost of living surveys track prices of a sample of items meant to approximate the expenditures of a typical consumer. This "market basket" of goods and services generally includes housing, food, transportation, medical care, and entertainment, among other things. Some measures compile very detailed market baskets while others compare only basic goods and services.

The market basket approach limits the effectiveness of both types of measures. Surveys that measure the change in prices over time, like the CPI, must avoid significant changes to their market baskets to maintain comparability. Most consumers' spending habits are in constant flux, however, due to changing tastes, technology, and availability of goods and services. For their part, surveys that compare prices between geographic areas must assume that a consumer in Kodiak would purchase the same basket of goods and services as a consumer in Seattle, which may not be the case.

How fast are prices rising?

The Anchorage Consumer Price Index (CPI) is probably the most used cost of living index in Alaska. Anchorage is one of about 80 urban communities in the country where a CPI is calculated as the long-term record of price changes. Because a CPI is not calculated for any other Alaska city, the Anchorage CPI is often used as the de facto statewide inflation measure.

The U.S. Department of Labor's Bureau of Labor

Statistics (BLS) conducts elaborate surveys of Anchorage consumers' spending habits to determine both the appropriate market basket of goods to be measured and the weight each item will have in the overall index. (See Exhibit 1.)

Exhibit 1 shows, for example, that the average Anchorage consumer spends nearly 43 percent of his or her consumption dollar on housing and 18 percent on transportation. In most categories the Anchorage weights are only slightly different from those used for the national CPI. The most notable exception is recreation, where Anchorage consumers spend 8.1 percent of their consumption dollars and national consumers spend only 5.9 percent.

BLS measures price changes by collecting prices for goods and services on a regular basis in Anchorage and other cities for which a CPI is produced. The Anchorage CPI is produced on a semi-annual basis (January-to-June and July-to-December time periods). The two semi-annual numbers are then combined to create an annual average, which is the number most often used in wage and rent contracts. (See Exhibit 2.)

All references to the CPI in this article are to the CPI-U (Consumer Price Index for all Urban Consumers). BLS also produces an index called the CPI-W (Consumer Price Index for Urban Wage Earners and Clerical Workers), which contains only data on urban consumers who are either wage earners or clerical workers. At the national level, the CPI-U represents about 80 percent of the population while the CPI-W represents only 40 percent. The CPI-W is useful in certain situations, but the CPI-U is the most prominent and frequently used measure.

As mentioned earlier, the CPI cannot be used to compare costs between different locations. For example, in 2003 the annual average index for Anchorage was 162.5 and the annual average index for the United States was 184.0. The higher U.S. number does not mean that prices are higher nationally than in Alaska. In fact, the contrary is true for most goods and services. The higher U.S. number means only that prices have

risen more at the national level since the base years of the early 1980s (1982-84) than they have in Alaska.

Inflation slightly higher in 2003

In 2003 the Anchorage CPI rose 2.7 percent, which was slightly higher than both Alaska's ten-year average of 2.1 percent and the national increase in 2003 of 2.3 percent. (See Exhibit 3.) It has now been ten years since Alaska recorded an inflation rate above three percent. As this exhibit shows, inflation in the early 1990s was significantly higher.

Anchorage prices in 2003 increased in most areas, apparel and upkeep being the exception. (See Exhibit 4.) Housing costs, the category with the largest weight, rose 2.3 percent over the year and transportation costs grew 4.5 percent. Although data on medical costs have not been published separately over the past two years because BLS has been unable to collect enough sample prices, medical care costs are still incorporated in the overall index. Other sources leave little doubt that medical costs continue to rise faster than most other components.

Anchorage Consumer Prices Rose moderately in 2003 3

Housing is the heavyweight

Exhibit 1 shows the different weights assigned in calculating the CPI. Housing represents the single largest weight since that is where average consumers spend the largest share of their consumption dollars. As a result, housing has the most influence on the overall index. It also gives the CPI a local flavor, creating index changes that often diverge from those seen in the national CPI, because it is usually local market forces that affect housing prices.

For example, during the late 1980s when the Anchorage real estate market crashed, the overall CPI index recorded nearly zero inflation because the value of housing was declining. During the same period the national housing market was robust, so the national index moved considerably ahead of Anchorage. During the past decade the Anchorage and national housing markets showed smaller differences, with the national rates tending to rise a bit faster, showing inflation in the rest of the nation to be higher than in Anchorage. Other CPI components are much less affected by local conditions. Price changes for gasoline, food, clothing, automobiles, and other goods and services are dictated more by national and international conditions than local ones.

Because of the weight the housing measure carries in the overall CPI, it is important to know some of its shortcomings. The CPI measures housing prices with "rental equivalency," which uses the current rental value of houses to compare prices, rather than actual home prices or appraised values. This method can overstate or understate inflation because actual house values and rental costs are not always closely connected.

In fact, in both Anchorage and the nation as a whole, house prices have risen noticeably in the last several years due to high demand fueled by low interest rates. Rental prices have not seen a similar increase, leading many to believe that recent CPI numbers understate inflation for the majority of Americans who own rather than rent. To isolate price changes other than housing, BLS produces an index called CPI All Items Less Shelter.

Calculating Index Changes

Movement of an index from one period to another is usually expressed as a percent change rather than a change in index points because index point changes are affected by the level of the index in relation to its base period while percent changes are not. The example in this box illustrates the computation of index points and percent changes.

| Index Point Change | |
|---|-------------|
| CPI-Anchorage 2003 | 162.5 |
| Less CPI for previous period-Anchorage 2002 | 158.2 |
| Equals index point change | 4.3 |
| Percent Change | |
| Index point difference | 4.3 |
| Divided by the previous index | 158.2 |
| Equals | 0.027 |
| Results multiplied by 100 | 0.027 x 100 |
| Equals percent change—Anchorage CPI 2003 | 2.7 |

Medical Costs Skyrocket 5 Housing remains tame

Anchorage CPI-U for selected components 1982-2003

(See Exhibit 4.) This index reveals less noticeable differences between Anchorage and the nation than does the CPI-U.

Medical care rises the fastest

The cost of medical care in Anchorage has shot upwards, although it is not weighted heavily enough to have a major effect on the overall index. (See Exhibits 1 and 5.) No other CPI component has come close to matching the steep increases in health care costs in the last 20 years. BLS has been unable to produce a separate medical care index since the first half of 2002, but in the decade from 1992 to 2001, medical care costs in Anchorage climbed more than 60 percent, compared to the 25 percent increase over the same period for the overall index. The story is similar at the national level. As the state and national population age and the need for health care continues to expand, rising costs will intensify the focus on medical care affordability.

Food costs around the state

Four times a year, the University of Alaska Fairbanks Cooperative Extension Service posts results from its surveys of the cost of food at home for a week in 20 Alaska communities and Portland, Oregon. (See Exhibits 6 and 7.) The food basket includes items that will provide the minimum levels of nutrition for an individual or family at the lowest possible cost. The survey also includes information on utility and fuel costs. The strength of this survey is its geographic coverage; no other survey covers as many Alaska communities. Another advantage is that it has been produced consistently for many years.

Being mostly limited to food, which makes up a relatively small portion of total consumption dollars, the survey is unsuitable for use as a comprehensive cost of living measure. Another limitation is the study's necessary assumption that the same items would be purchased in all of the communities surveyed. The study recently began including grocery items delivered to rural communities, a widespread practice in Alaska, but food items obtained through barter or brought back to communities as baggage or private cargo are not captured. The study also makes no allowance for the consumption of subsistence foods instead of store-bought items.

Food costs highest in Naknek-King Salmon

According to the December study, a family of four enjoyed the lowest food costs in Anchorage, Ketchikan, Tok and Mat-Su. Tok's December data should probably be treated as an aberration. In previous years Tok's food costs tended to be higher. (See Exhibit 7.) The highest costs tend to be in remote communities which are serviced by air most of the year and by barge during the summer months. Bethel, Nome, Dutch Harbor, and Naknek-King Salmon belong in this category.

Communities connected to a road system or the Alaska Marine Highway fare a little better, with prices somewhere between those found in urban areas and more isolated areas. Kodiak, Cordova,

Two-Bedroom Apartments

and Haines are examples. Factors other than accessibility that affect food prices are the size of the market and the degree of competition among food suppliers in the community.

Juneau tops the list in rents

Housing costs are often a good proxy for an area's cost of living because they make up such a large slice of total expenditures. Information on housing rental prices in ten areas around the state is available through a survey conducted for the Alaska Housing Finance Corporation (AHFC) by the Alaska Department of Labor and Workforce Development. The survey collects monthly rental costs for two-bedroom apartments and three-bedroom single-family homes. (See Exhibits 8 and 9.)

In Alaska, the cost of housing can vary dramatically from place to place. Housing supply, building costs, the condition of the local economy, and demographic change are all factors that enter into housing cost differences.

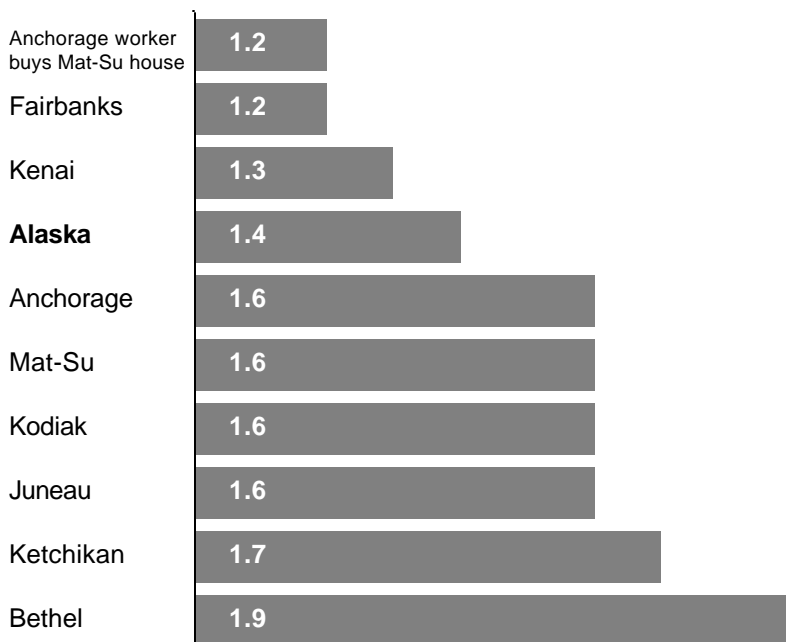

In 2003, rental costs for houses were highest in Juneau and Anchorage. (See Exhibit 8.) Juneau has been near the top of the list for years, but the Anchorage rental market for houses heated up in 2003, rising almost \$200 and moving from the fourth highest in 2002 to the second highest in 2003. By comparison, Juneau's rental rate for housing rose only \$44 over the same period, and in Valdez/Cordova, housing rental prices fell nearly \$100.

Juneau also tops the list for apartment rental costs, though the \$967 monthly price is unchanged from 2002. Apartment rentals in Anchorage increased \$45 in 2003 but remained lower than many areas of the state. Kodiak had the second most expensive apartment rentals at \$898 a month, an increase of about \$70 from 2002. Four of the ten areas surveyed reported lower apartment rental prices in 2003 than in 2002.

11 Housing Affordability

Wage earners needed to buy average house

2nd half 2003

Sources: Alaska Department of Labor and Workforce Development, Research and Analysis Section, and Alaska Housing Finance Corporation

Housing sale prices highest in Anchorage and Juneau

A survey of lenders reveals that for houses sold during the second half of 2003, the highest average prices were in Anchorage and Juneau at \$241,000. That number is about \$30,000 higher than the statewide average and noticeably higher than all of the other communities for which data were available.

The average sale price for a Mat-Su home was more than \$60,000 lower than an Anchorage home, partly explaining why the Mat-Su Borough has grown dramatically in recent years and why more and more Alaskans are commuting from Mat-Su to Anchorage. It is important to note that this survey captures only the prices of homes actually sold; how closely that amount approximates the value of average homes in the various communities is a separate question.

Fairbanks tops list of housing affordability

The Alaska Housing Finance Corporation also establishes a housing affordability index for ten areas in the state. (See Exhibit 11.) This index not only takes the cost of housing into account but also the ability to pay for this housing, using the average wages in the respective areas and determining how many wage earners would be needed to afford the average house. Combining these two factors—housing costs and average wages—yields some interesting results.

Although the Mat-Su Borough has some of the lowest housing costs in the state, for those who both live and work in the borough, purchasing

a home there is no more affordable than it is for those who live and work in Anchorage. In other words, Anchorage's higher housing costs are balanced by the city's higher wages, whereas low housing costs combine with low wages in Mat-Su. As a result, an increasing number of Alaskans are living in the Mat-Su Borough and working in Anchorage, combining relatively low housing costs with relatively high wages.

Fairbanks housing is also very affordable, requiring only 1.2 wage earners to purchase the average home. In Juneau, despite annual wages that tend to be above average, housing is less affordable because of the very high price of homes. Not surprisingly, housing in Bethel is substantially less affordable because of its remote location.

ACCRA looks at higher income households

Every quarter the nonprofit American Chamber of Commerce Researchers Association (ACCRA) publishes the results of its detailed cost of living surveys of about 400 cities. ACCRA's market basket is meant to capture the expenditure patterns of professional and executive households with incomes in the top fifth of all U.S. households.

Expenditures for each city are compared to the average for all cities surveyed, which is assigned a score of 100. For example, a city with an index score of 125 has costs 25 percent higher than the average of all ACCRA cities surveyed. The survey does not include taxes, a significant point for Alaskans, whose tax burden is the lowest in the country.

The fourth quarter 2003 ACCRA survey reveals that the cost of living for Alaska's higher income

Source: Runzheimer's Living Cost Index, December 2003

residents is still well above average. Fairbanks, Juneau, and Kodiak all recorded composite index scores of at least 124.7. (See Exhibit 12.) Anchorage has not been included in the ACCRA study since the fourth quarter of 2002, but that quarter's survey reported a composite score for Anchorage of 121.8.

Both Juneau and Kodiak were among the 20 most expensive ACCRA cities surveyed and Fairbanks fell just outside of that list. (See Exhibit 13.) Health care costs stand out as particularly high in the Alaska cities ACCRA surveyed, but housing, groceries, and utilities are all significantly above the average city.

Exhibits 12 and 13 show that housing costs on both the East and West coasts raise living costs significantly, while generally cheaper housing in the middle of the country lowers overall costs there. Of the 20 most expensive ACCRA cities, all but Chicago are either on or near one of the nation's coasts.

Runzheimer Survey

The Runzheimer Plan of Living Cost Standards looks at households on the lower end of the income spectrum. (See Exhibit 14.) The Alaska Department of Labor and Workforce Development contracts with Runzheimer to survey geographic cost differentials for a family of four with an annual income of \$32,000. The survey determines how much more or less it would cost in various cities for the family to maintain the same standard of living \$32,000 would purchase in a hypothetical standard U.S. city.

According to the Runzheimer survey, a household in Anchorage would need an income of \$34,682 to maintain the standard of living obtainable with \$32,000 in the standard city. A slightly higher income would be necessary in Fairbanks, and a significantly higher amount in Juneau. The principal difference between the three Alaska cities surveyed by Runzheimer is the price of housing for relatively low-income families. While housing in Anchorage and Fairbanks costs around \$16,300 a year (costs include mortgage payments, real estate taxes, insurance, utilities, and maintenance), in Juneau housing costs are more than \$4,000 higher.

Not surprisingly, the nation's most expensive cities for low-income families are those with expensive housing. No city illustrates this better than San Francisco, where housing costs are 368 percent as high as the standard city. As a result, it would cost more than \$72,000 to live in San Francisco with the same standard of living that could be purchased with \$32,000 in the standard city.

The military's cost of living index

A study new to this year's cost of living article is the United States Department of Defense (DOD) cost of living index for all of its overseas locations, including Alaska and Hawaii. (See Exhibit 15.) The DOD index shows the allowance paid to service members stationed in high-cost areas to help them maintain purchasing power similar to that obtainable in the continental U.S.

This adjustment is calculated on income remaining after housing expenses, taxes, savings, life insurance, gifts, and charitable contributions are deducted. DOD collects pricing data on approximately 120 goods and uses the Bureau of Labor Statistics consumer expenditure survey for assigning weights to the various goods. One of the DOD index's strengths is its broad geographic coverage—27 Alaska locations are included. Another strength is that the data are relatively current. Its biggest weakness is that it does not include housing, which is treated separately by the military with a housing allowance program. For more information on this index visit: www.dtic.mil/perdiem/faqcola.html.

State of Alaska geographic differentials

One of the most comprehensive data sets of state cost differentials was produced in a 1986 State of Alaska survey done to determine location pay for state workers. (See Exhibit 16.) The results of this survey are still used by the state. Workers in Fairbanks, for example, receive a four percent higher wage or salary than their colleagues in Anchorage in similar positions. The highest geographic differential pay goes to state workers in Barrow and Kotzebue, where cost of living was determined to be 42 percent higher than in Anchorage, Juneau, Kenai, and the other cities in Exhibit 16 with scores of 100.

Summary

Cost of living questions can have complicated answers and no single survey or index can supply a perfect answer. Each survey has specific

limitations that must be considered before reaching conclusions about either the change in costs over time or the difference in costs from one place to another. With that in mind, users have before them an abundance of information to explore the cost of living in Alaska, one of the state's most basic economic issues.

What does \$100 in 1980 dollars equal today?

The Anchorage CPI-U can help answer the often asked question, how much money would it take to equal a dollar from some earlier year?

Use the equation below:

$$\begin{array}{l} \text{2003 Anchorage CPI, (see Ex. 2)} \\ \text{Divided by 1980 Anchorage CPI-U} \end{array} \quad \frac{162.5}{85.5} = 1.90$$

Multiply 1.90 by any number of 1980 dollars and you will have the 2003 equivalent. So, \$190 in 2003 would have the same purchasing power as \$100 did in 1980.

The formula can be reversed to deflate current dollars to some earlier year (\$100 in 2003 would equal \$53 in 1980). Inflation calculators that require only the years and a dollar amount are also available on many web sites, including ours:

Owner occupancy rates and monthly costs for owners and renters

Owning one's own home has long been considered a part of the American dream. More Alaskans took a step toward realizing that dream in the 1990s.

This article uses decennial census housing data from the 1990 and 2000 censuses to examine homeowner occupancy trends over the decade, and looks at monthly owner and renter costs to measure affordability.

Owner occupancy

Housing data in the 1990 and 2000 decennial censuses show whether an occupied housing unit is owner-occupied or renter-occupied. A housing unit is owner-occupied if an owner or co-owner lives in the unit. Owner occupancy rates increased in both Alaska and the U.S. from 1990 to 2000. Though owner occupancy in the state was up by the end of the decade, at 44th in the country, Alaska still ranked near the bottom among the states.

In 1990, 105,989 of the total occupied housing units in the state, 56.1%, were owner occupied. By 2000, lower interest rates, increased wages, lower unemployment rates, and loan programs that required lower down payments worked toward increasing this number to 138,509 units, or 62.5% of the total. This compares with 64.2% for the nation in 1990 and 66.2% by 2000. Alaska owner occupancy rates improved 11% over the decade, more than three times the nation's 3% growth rate in owner occupancy.

Recent census housing and vacancy survey data suggest that in 2003, Alaska had a home ownership rate of 70%, higher than the U.S. average for the same period. However, due to small sample size and different collection procedures, this data may not be directly comparable to data from the decennial censuses.

Owner-Occupied Housing ¹ By area – 2000

| Borough/Census Area | Percent Owner-Occupied Housing |
|------------------------------------|--------------------------------|
| Matanuska-Susitna Borough | 78.9% |
| Kenai Peninsula Borough | 73.7% |

| Fairbanks North Star Borough | 54.0% |
| Bristol Bay Borough | 50.0% |
| North Slope Borough | 48.9% |
| Aleutians West Census Area | 27.8% |

Source: U.S. Census Bureau

Matanuska-Susitna Borough had the highest homeowner occupancy rate of any area in the state in the last decade. In 2000, 78.9% of housing units in Mat-Su were reported owner-occupied. (See Exhibit 1.) Its location as a convenient commute to Anchorage, as well as a favorable supply of affordable housing, contributed to Mat-Su's becoming the decade's fastest growing area. A common life-style is to buy or build and live in a home in Mat-Su and commute to Anchorage. This phenomenon is an important factor in Mat-Su's high owner occupancy rate.

Aleutians West Census Area, the North Slope and Bristol Bay boroughs had the lowest percentage of owner-occupied homes in 2000. The seasonal nature of fish processing in Aleutians West and Bristol Bay and the relatively high percent of nonresidents in the workforce contributed to relatively low rates of owner-occupied homes. The North Slope Borough's low owner-occupied

figures are related to the significant number of units in the Barrow area owned by the borough and local housing authority.

Owner costs as a percentage of household income

Based on Census 2000 data, Alaska ranked 14th nationally in median housing costs for owners as a percentage of household income in 1999. Owner costs include expenses such as mortgage, taxes, insurance, utilities, and fuel. At 19.7%, costs for homeowners in Alaska were somewhat higher than the national average of 18.7%. California homeowners spent the highest percent of their income on housing at 22.5% and West Virginians the lowest at 14.6%.

Home ownership costs were highest in Juneau and the Ketchikan Gateway Borough at an average of 21.0% of household income. They were lowest in the Denali Borough at 10.9%. (See Exhibit 2.)

2 Median Owner Costs As percent of household income – 1999

Includes expenses such as mortgage, taxes, insurance, utilities, and fuel.

Sources: U.S. Census Bureau and Alaska Department of Labor and Workforce Development, Research and Analysis Section

Mortgages are a major homeowner cost. When a mortgage is paid off, owner costs decrease substantially. Generally, an older population is more likely to have paid off a home mortgage. Denali Borough is one of several areas with the lowest owner costs that also rank among the highest in average median age.

Renter costs as a percentage of income

Census 2000 also captured median gross rent (expenses such as rent, utilities, and fuel) as a percentage of household income in 1999. In this category, the average renter in Alaska fared slightly better than those in the nation as a whole. Renters in the U.S. spent 25.5% of their gross income on rent while Alaskans were not far behind with 24.8%. Alaska ranked in the middle of all states, tied with three others in 25th place.

Renters in Sitka applied the largest percentage of their household income toward rent. (See Exhibit 3.) They paid 27.9% while Wade Hampton Census Area and Denali Borough at 15.6% and 15.8% paid the least. In general, renters in the

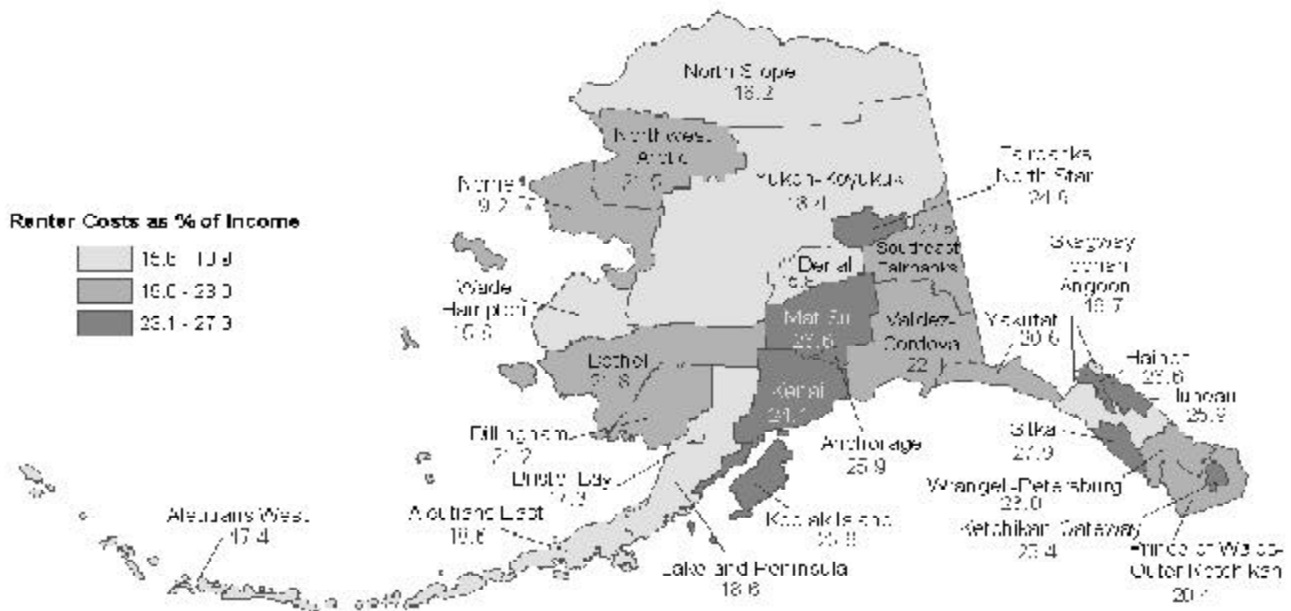

Northern, Western, and Southwestern regions of the state paid a smaller percentage of their income for rent related expenses than renters in other regions of the state.

30 percent guideline

Some lenders and budget advisors suggest spending no more than 30% of household income for housing related expenses. When this guideline is applied to census data, it appears that Alaska homeowners are conforming to national trends, but renters in the state are not.

In 1990, 52.6% of Alaska homeowners reported spending less than 20% of their monthly income on ownership costs, while 20.5% said they spent 30% or more. (See Exhibit 4.) By 2000, the proportion spending the smaller percentage decreased to 50.8% while those spending 30% or more increased to 23.0%. This paralleled the U.S. trend, though nationally, a slightly larger

Includes expenses such as mortgage, taxes, insurance, utilities, and fuel.
Source: U.S. Census Bureau

percentage in the nation spent less than 20% and a slightly smaller percentage spent more than 30% per month.

When the 30 percent guideline was applied to renters, Alaska moved in the direction opposite the rest of the country. (See Exhibit 5.) In 1990, 33.4% of renters in the state reported spending less than 20% of their monthly income on rental costs, and 30.7% reported spending 30% or more. By 2000, the proportion spending the smaller percentage dropped to 31.1% and those spending more than 30% of income rose to 32.8%. Nationally, this trend was the reverse as a growing number of renters paid less than 20% and fewer paid 30% or more in 2000.

Summary

Home ownership in Alaska increased during the 1990s, but still ranks near the bottom 10% of all states. Alaska's median owner costs as a percentage of household income in 1999 ranked in the upper 30% nationally while the same measure for renters placed Alaska near the middle of all states. Alaska homeowners paralleled the rest of the country over the decade as fewer owners paid less than 20% of their income and a higher percentage paid 30% or more. Alaska renters diverged from U.S. renters as a lower percentage of renters in the state paid less than 20% and a higher percentage paid 30% or more — a trend that was opposite the rest of the country for the decade.

March Economic Overview

First quarter gets the year off to a reasonably good start

Alaska Employment Scene

Neal Fried
Labor Economist

Employment during the first quarter of 2004 is running 4,500 jobs or 1.6 percent ahead of last year's first quarter. Most of the state's industrial sectors showed employment growth over the first quarter of 2003. (See Exhibit 1.) In fact, in a recent report of state rankings, Alaska ranked third in the nation for employment growth in 2003—bested only by Nevada and Hawaii. In March of this year Alaska ranked fourth in the nation for employment growth. The explanation for Alaska's ranking is not that its economic picture changed but rather because the nation's employment picture remained soft. National employment growth numbers lagged Alaska's through early 2004, but by March national growth began to improve. If this trend continues, the national growth rate should move closer to or possibly beyond Alaska's.

The news for Alaska's job seekers also remains relatively positive. Alaska's unemployment rate, though higher than the nation's, also remains below historical averages and is coming in slightly below year-ago levels. That does not ignore the fact that in a number of areas in the state high levels of unemployment prevail.

Health care & social assistance and construction lead the way

Education & health services and construction were responsible for over half of the new wage and salary jobs in the state. During the first quarter of the year education & health services

Most Sectors Continue to Grow **1** In first quarter of 2004

Vs. first quarter 2003

Source: Department of Labor and Workforce Development, Research and Analysis Section

was running 1,800 jobs ahead of last year. Nearly all this growth is in the health care and social assistance sector. Education represents only seven percent of the sector and its overall level of employment has changed little. The relentless growth of health care is a long-term trend that has already received a great deal of attention. Interestingly, social assistance employment has been nearly as dynamic as health care and represents almost a quarter of the overall sector.

Included in social assistance are employers such as the Salvation Army, Tanana Chiefs Conference in the Interior, Hope Community Services of Anchorage, Association of Village Council Presidents in Bethel and many other large and small social service organizations. The agencies mentioned are among the largest 100 private sector employers—in fact, 10 of the state’s largest private sector employers are in social assistance.

In 2003, this sector grew 19 percent and this trend continues into 2004. What accounts for this expansion is not completely clear. Privatization of public services and increases in federal funding certainly explain some of the growth.

Construction employment is now entering its eighth year of uninterrupted growth; during the first quarter of 2004 it was running nearly 900 ahead of year-ago levels. There is little reason to doubt that this trend will continue during the remainder of the year.

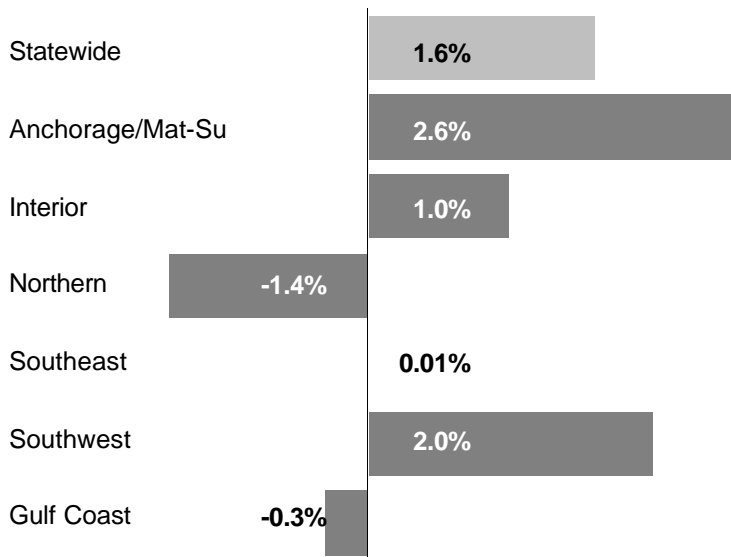

Retail and leisure & hospitality picture positive—government mixed

Retail trade’s moderate gains should continue through the remainder of the year. The single largest gains occurred in late April when a new Wal-Mart opened in Fairbanks with a workforce of approximately 300. Both Lowe’s and Home Depot recently announced they will open new stores in Wasilla, but this will not happen until 2005. First quarter employment numbers for leisure & hospitality were also positive. This sector will get another big boost later this year when three more hotels open in Anchorage and a number of expansions elsewhere in the state come on line. Leisure & hospitality’s economic fundamentals look good, given the relatively positive outlook for the visitor industry. Small increases in federal and local government are keeping government employment numbers barely positive. State government employment numbers were actually running slightly below year-ago levels and this trend is not likely to change.

A bit of good news in the fish world

For the second year in a row, seafood processing’s employment numbers are upbeat—encouraging given its recent track record. After seven years of losses between 1996 and 2002 and multiple plant

2 Picture is Mixed Around the State In first quarter of 2004

Source: Department of Labor and Workforce Development, Research and Analysis Section

closures, the numbers provide some glimmer of hope. During the first quarter of the year, strong ground fish catches have been responsible for these better-than-average numbers. The strong salmon forecast for the 2004 season fuels hope that the fisheries numbers will remain ahead of 2003's levels.

Except for oil and timber the negatives remain small

For the third straight year, oil industry employment remains in the red. First quarter employment was down by nearly 400 compared to last year's first quarter. There is some expectation that these losses should narrow with a moderate pickup in activity later in the year. The logging industry continued to lose jobs during the first quarter (150). This decline represents the fifth year of losses. It appears 2004 will bring no relief to timber woes. As recently as 1997 more than 1,500 logging jobs existed in the industry, compared to approximately 500 during the first quarter of this year.

Half of the state's six regions are growing

Both the Southwest and Anchorage/Mat-Su regions outperformed the statewide average. (See Exhibit 2.) Southwest's mostly positive story is tied to strong ground fish catches this late winter and healthy salmon runs that should keep these numbers positive during the remainder of the year. The Anchorage/Mat-Su region's figures mirror the statewide picture, which is not surprising since this region represents slightly more than half the state's workforce. The Mat-Su Borough's booming growth provides the region with its extra vitality. Interior's numbers are a bit sluggish, but expectations are that these numbers will pick up as the huge military related construction season gets underway. Southeast's picture was nearly flat; the pluses barely offset the negatives. The

region's strongest suit was health care and its weakest was government. Both state and local government employment were running slightly negative, only partially offset by positive federal numbers. Weak oil industry numbers help explain the Northern and Gulf Coast regions' weak showings.

Alaska ranked 12th in income on 2003

Personal income data for 2003 was just released and Alaska ranked 12th in the nation. (See Exhibit 3.) Alaska's total personal income and per capita income grew at a rate nearly identical to the rest of the nation's. In 2003 Alaska's personal per capita income reached \$33,568 and total income was \$21.8 billion.

Alaska 12th in Per Capita Income 2003 **3**

| Rank | | Per Capita Income | Percent of U.S. Avg. |
|------|---------------|-------------------|----------------------|
| 1 | Connecticut | \$43,173 | 136 |
| 2 | New Jersey | 40,427 | 128 |
| 3 | Massachusetts | 39,815 | 126 |
| 4 | Maryland | 37,331 | 118 |
| 5 | New York | 36,574 | 116 |
| 6 | New Hampshire | 34,702 | 110 |
| 7 | Minnesota | 34,443 | 109 |

2003 Benchmark

Comparisons between different time periods are not as meaningful as other time series produced by Research and Analysis. The official definition of unemployment currently in place excludes anyone who has not made an active attempt to find work in the four-week period up to and including the week that includes the 12th of the reference month. Due to the scarcity of employment opportunities in rural Alaska, many individuals do not meet the official definition of unemployed because they have not conducted an active job search. They are considered not in the labor force.

Employer Resources

Are you turning away qualified applicants because your insurer will not insure them? The Fidelity Bonding Program provides an incentive for employers to give certain individuals, who might otherwise be overlooked, a chance at employment. Employers receive the bonds free-of-charge as an incentive to hire hard-to-place job applicants.

The image shows two overlapping browser windows from Microsoft Internet Explorer. The top window displays the 'Links for Employers' page on the Alaska Department of Labor & Workforce Development website. A white arrow points to the 'Fidelity Bonding Program' link in the list. The bottom window shows the 'Fidelity Bonding Program' page, which includes the following text:

Fidelity Bonding Program

Is the lack of bonding coverage keeping you from working or from hiring someone?

WE CAN HELP!

The Fidelity Bonding Program is administered by the Alaska Department of Labor and Workforce Development, Employment Security Division. It is designed to eliminate bonding as a barrier to employment, and alleviate employer concerns about hiring at-risk job applicants.

Who is considered "at-risk"?

- Ex-offenders, including anyone with a record of arrest, conviction or imprisonment, and anyone who has ever been on probation or parole
- Ex-addicts (persons with a history of alcohol or drug abuse)
- Persons having a poor credit record or who have declared bankruptcy
- Economically disadvantaged persons who lack a work history
- Individuals who were dishonorably discharged from the military
- Others who experience a barrier to gaining employment due to their personal background

How Bonds can help

- Employers receive the bonds free-of-charge as an incentive to hire hard-to-place job applicants.
- The bond insurance reimburses the employer for any loss due to employee theft of money or property.
- There is no deductible amount (i.e., 100% bond insurance coverage).

There are no forms or other paperwork for the employer to sign, and no processing to delay matters. The insurance can be put into effect almost instantly. Employment Security Division staff complete the one page form for bond loss once "the bond insurance can apply to any job" where
